Osnovni pojmovi

Zemljotres	predstavlja oscilovanje čestica tla izazvano prirodnim ili vještačkim uzrocima. Posljedica su oslobođene Zemljine unutrašnje energije. Nastaje usljed pomijeranja tektonskih ploča, kretanja Zemljine kore ili pojave udara, a posljedica je podrhtavanje Zemljine kore zbog oslobađanja velike količine energije.
Epicentar	je mjesto na Zemljinoj površini, okomito iznad hipocentra ili žarišta zemljotresa. U slučaju zemljotresa, epicentar je okomito iznad tačke u kojoj rasjed počinje pucati. To je najčešće i mjesto na kojem se zemljotres najjače osjeti i gdje napravi najveću štetu.
Hipocentar	ili žarište zemljotresa je mjesto u unutrašnjosti Zemljine kore od koga počinju da se prostiru seizmički talasi. Hipocentri se po dubini može svrstati u 3 kategorije: plitki, srednji i duboki. Plitki su oni do dubine do 70 km ispod površine Zemlje, najčešće u zonama razmicanja litosfernih ploča. Srednji su oni između 70 i 300 km ispod površine Zemlje. Duboki se nalaze na dubinama između 300 km i 730 km ispod površine Zemlje, a to su najčešće hipocentri u zonama subdukcije.
Izoseiste	su linije kojima na karti spajamo mjesta jednake jačine zemljotresa.
Dubina žarišta	je udaljenost između epicentra i hipocentra.

- Intenzitet** zemljotresa odražava rušilački efekat zemljotresa na površi Zemlje. Izražava se različitim skalama, od kojih se u Evropi najčešće primenjuju MCS i MSK - 64 skale.
- Magnituda zemljotresa** predstavlja jedinicu mjere količine oslobođene energije u hipocentru. Izražava se magnitudnom skalom Rihtera koja ima 9 stepeni.
- Richterova skala** ili magnitudna skala definirana je brojem kojim se označava seizmička energija proizišla iz zemljotresa. Skala se procjenjuje prema logaritamskom zapisu najveće amplitude.
- Mercalli-Cancani-Siebergova skala (MCS skala)**
češće nazivana samo kao Mercallijeva skala, definira pojave i promjene koje zemljotresi izazivaju kod ljudi i životinja uz ocjenu veličine štete na objektima, te sagledavanje promjena u prirodi kao posljedice zemljotresa.

Uvod

Kao prvo treba napomenuti da je zemljotres, kao prirodna pojava, stohastički proces koji se javlja sporadično u vremenu i prostoru i da je nezavisan od prošlih i budućih seizmičkih pojava na određenoj teritoriji. Trajanje razorne snage zemljotresa je od nekoliko sekundi do najviše jedne minute. S druge strane, zemljotres “ne poznaje” bilo kakve političke ili administrativne podjele tako da zemljotresi velike jačine mogu izazvati materijalne štete i odnijeti ljudske živote na veoma velikim udaljenostima od epicentra (područja u kojem se najjače manifestuje).

Teritorija BiH spada u seizmički relativno aktivnu zonu. Generalno gledano ovo područje je tektonski vezano za veliki rasjed Zemljine kore koji od sjeverne Indije (Himalaji) preko teritorije Irana, Turske i Grčke (istočni Mediteran) te prelazi južnim dijelom teritorije gdje skreće ka sjeverozapadu. Pored ovog globalnog rasjeda postoji nekoliko značajnih regionalnih rasjeda (bugojanski, višegradski, neretvanski, banjalučki). Duž svih ovih rasjeda mogu se generirati zemljotresi razorne jačine. Pored toga, na području planine Treskavice (koja je zbog toga i dobila ime) registrovana je epicentralna zona veoma snažnih zemljotresa. Na svim ovim područjima, prema našoj historijskoj arhivi, javljali su se zemljotresi magnitude veće od 3,0 Richtera ili više od V stepeni Merkalijeve skale u epicentru. Također, na teritorijama Dubrovnika, Makarske, Knina i Crne Gore javljaju se zemljotresi razorne snage koji mogu imati značajan efekat i na teritoriji BiH.

Seizmotektonske i geotektonske karakteristike teritorije BiH

Područje Bosne i Hercegovine je uključeno u središnje dijelove Dinarskog planinskog sistema koji je smješten sjeveroistočno od kompresionog geotektonskog kontakta između Jadranske mase i Dinarida. Jadranska masa (Adriatic microplate), kao dio Afrike, je „pritisnuta“ između Apenina i Dinarida duž seizmički aktivnih rasjeda. Zabilježeni zemljotresi na području Bosne i Hercegovine vezani su za energiju nastaloj subdukcijom Afričke pod Evropsku ploču. Ova energija, primarno tektonska energija, je distribuirana kao seizmička energija preko seizmički aktivnih rasjeda. Na slici 1, prikazane su glavne tektonostratigrafske jedinice i rasjedi u Bosni i Hercegovini, a na slici 2. glavne strukture i seizmički aktivni rasjedi.

Analiza mehanizma zemljotresa ukazuje na preovlađujuću kompresionu tektoniku sa reversnim rasjedima u južnom dijelu i horizontalnim u sjevernim dijelovima zemlje. Upoređujući tektonske podatke sa dogođenim zemljotresima očigledna je veza između rasjednih struktura i zemljotresa. Na bazi postojećih podataka može se zaključiti da se jaka seizmička aktivnost javlja uz granice geotektonskih jedinica (pravca SZ-JI), duž longitudinalnih dislokacija (pravca SZ-JI) i poprečnih rasjeda (pravca SI-JZ i S-J).

Seizmičnost Teritorije BiH

Na osnovu raspoloživih podataka urađen je izvještaj o seizmičnosti teritorije Bosne i Hercegovine. Na osnovu seizmoloških i geoloških podataka definirane su seizmički aktivne zone i aktivni seizmotektonski rasjedi u kojima se generiraju zemljotresi. Područje Bosne i Hercegovine je uključeno u središnje dijelove Dinarskog planinskog sistema koji je smješten sjeveroistočno od kompresionog geotektonskog kontakta između Jadranske mase i Dinarida. Jadranska masa (Adriatic microplate), kao dio Afrike, je „pritisnuta“ između Apenina i Dinarida duž seizmički aktivnih rasjeda. Zabilježeni zemljotresi na području Bosne i Hercegovine vezani su za energiju nastaloj subdukcijom Afričke pod Evropsku ploču. Ova energija, primarno tektonska energija, je distribuirana kao seizmička energija preko seizmički aktivnih rasjeda. Na samoj teritoriji BiH gotovo svakodnevno se javljaju zemljotresi intenziteta manjeg od III stepena Merkalijeve skale, koje registruju samo instrumenti. Snažniji zemljotresi su relativno rijetki. Dubina hipocentra se kreće od 2 do 35 km.

Podaci o zemljotresima su podijeljeni u tri glavne skupine (perioda):

- period prije pojave seizmoloških instrumenata, tzv. istorijski period. Podaci su prikupljani na osnovu istorijskih zapisa u arhivama Beča, Dubrovnika, Istanbula i Kotor. Prema tim zapisima izvršena je procjena seizmičkog intenziteta, odnosno magnitude i određena je epicentralna zona pojedinih zemljotresa
- nakon 1900. godine došlo je do naglog povećanja broja zemljotresa, ne zbog pojačane seizmičke aktivnosti nego zbog postavljanja mehaničkih i elektromehaničkih seizmoloških instrumenata koji su mogli registrovati seizmička događanja i ispod je prvi seizmograf postavljen i počeo da radi 1905. godine)
- od 2000. godine kada su u upotrebu ušli digitalni seizmografi.

„gnozu“ seizmičkih događanja za bilo koju teritoriju, ipak na osnovu instrumentalnih podataka i fizikalni model seizmičnosti, došlo se do zaključka da se u narednih 100 godina na teritoriji BiH mogu očekivati zemljotresi intenziteta do VIII stepeni Merkalijeve skale. Zemljotresi tog intenziteta izazivaju materijalna oštećenja na građevinskim objektima, uglavnom bez ljudskih žrtava. Međutim, za vremenski period od 100 i više godina, prema ovim prognozama, može doći do razornih zemljotresa u jugoistočnom i sjeverozapadnom dijelu BiH (područje Trebinja, Neuma, Banja Luka i planine Trskavice) koji mogu izazvati ogromne materijalne štete na građevinskim objektima i odnijeti mnogo ljudskih života.

gdje je:

Datum (dan, mjesec, godina) – datum pojave zemljotresa

Vrijeme (h-sat, m-minuta, s-sekunda) – vrijeme pojave zemljotresa (GMT)

Latt. (lattituda) - geografska širina epicentra zemljotresa

Long. (longituda) - geografska dužina epicentra zemljotresa

M – magnituda zemljotresa u hipocentru (Richter)

h_o – dubina hipocentra zemljotresa (km)

l_o – intenzitet zemljotresa u epicentru (MCS skala)

Karta epicentara

U kartu epicentara uneseni su podaci iz kataloga zemljotresa od 2001. do 2010. godine.

Čestina pojave zemljotresa

Čestina (ili učestalost) pojave zemljotresa za teritoriju BiH od 2001. do 2010. godine je predstavljena na grafikonu gdje je na apscisi datum pojave zemljotresa, a na ordinati magnituda zemljotresa. Na ovaj grafički način predstavljanja moguće je stvoriti određenu predodžbu kako se često javljaju zemljotresi, odnosno intervale u kojima je bilo “zatišje” ili je pojačana seizmička aktivnost.

Oslobodena seizmička energija

Oslobodena seizmička energija zemljotresa za teritoriju BiH od 2001. do 2011. godine je predstavljena na grafikonu gdje je na apscisi datum, a na ordinati kumulativna (zbirna) energija u Joulima. Ovim grafikonom se može stvoriti određenu predodžbu koliko se često oslobađa seizmička energija i pojavu jačih zemljotresa (na grafikonu “skok” linije).
